RE: Supplemental Field Investigation
Syro Facility
Centerville, Utah

The completion of the supplemental field investigation initiated on 2/14/96 will be performed on 3/22/96. Slotted ¾" I.D. pvc casing pipe will be installed at the three locations (DH-54, DH-55 and DH-56). Each location will be drilled to a depth of 22 feet. The slotted sections will extend between 7 to 22 feet below ground surface. The installation of the slotted pvc will insure the collection of adequate sample volume. The locations proposed for sampling have historically been very slow in producing sample volume due to the low recharge of the water bearing zones. Previous sampling in the area has identified peak concentration of indicator parameters in the shallow silty sand layers (less than 20 feet).
